PRESIDENT'S LETTER

Jim Files

Hello fellow members!

For me, the routine is always the same every morning. I let Blue, my border collie out. What I have in mind and he has in mind differ greatly.

He goes "hunting". His favorite prey are birds.

Lucky for them, they fly. He starts with, if available, the Great Herons.

Next he attacks the smaller, ducks and mocking birds, while neither cooperate.

If desperate, he goes for a sparrow. Each morning, I get to the office and also begin the "hunt", but this time for oil and gas. We all in this business prefer the "Great Herons", but in the end are only too happy to capture the lone "sparrow".

I hope you are present for the meeting this week. I look forward to being "re-schooled" in seismic reprocessing. A lot of data comes to mind that I have seen that needs a redo.

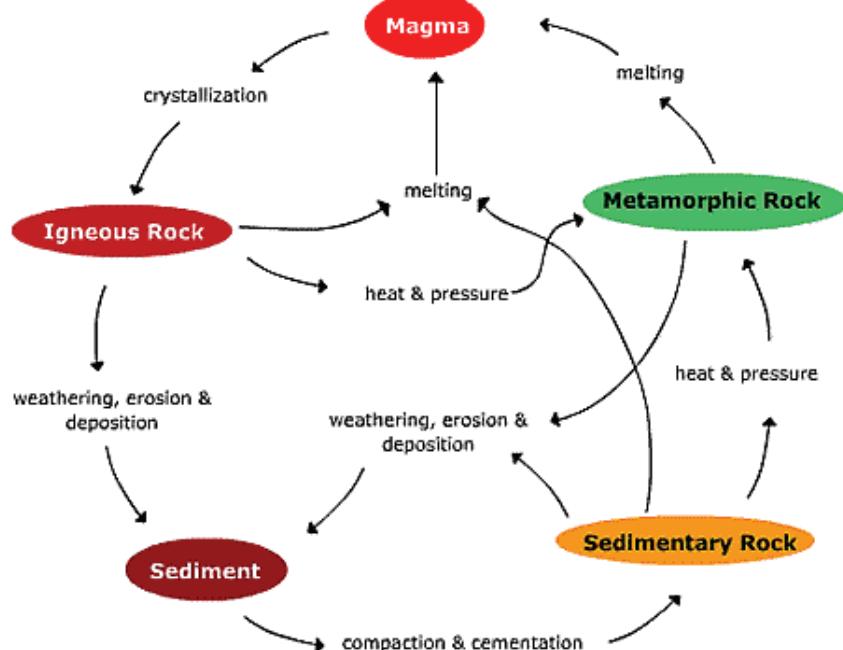

I look forward to seeing you on Thursday!

Best Regards,

Jim Files

MGS MEETING SCHEDULE

When	What/Who	Where
September 13, 2012	Fall BBQ	Jackson Yacht Club-5:30pm
October 4, 2012	Steve Walkinshaw The Lower Brown Dense Lime Trend	River Hills – 11:30am
November 8, 2012	Morgan Brown Prestack Depth Migration for “Easy” Onshore Plays	River Hills – 11:30am
TBD	Christmas Party and Dance	Colonial Country Club
January 10, 2013	TBD	River Hills – 11:30am
February 14, 2013	Kirk Barrell Tuscaloosa Marine Shale	River Hills – 11:30am
March 14, 2013	TBD	River Hills – 11:30am
April 11, 2013	Boland Scholarship Awards	River Hills – 11:30am
May 9, 2013	Spring Fling	Jackson Yacht Club– 5:30pm

OFFICERS MEETINGS

- August 4, 2012
- September 6, 2012
- September 27, 2012
- November 1, 2012**
- December 6, 2012
- January 3, 2013
- February 7, 2013
- March 7, 2013
- April 4, 2013
- May 2, 2013

NOVEMBER SPEAKER

Morgan Brown

Prestack Depth Migration for "Easy" Onshore Plays?

Abstract:

Traditionally, prestack depth migration (PSDM) was considered an exotic technology, applicable only for imaging "complex" geology. Offshore subsalt imaging drives the use of the most advanced PSDM technologies, like Reverse-Time depth Migration (RTM). However, given the recent resurgence of onshore exploration, we ask: can PSDM make an impact on "easy" onshore plays? We present an unconventional oil shale (Niobrara) case study which convincingly illustrates three key reasons for (re)considering PSDM:

- 1) Remove false time structures caused by lateral variations in velocity.
- 2) Improve focusing of dipping beds and faults.
- 3) Improve the accuracy of seismic attributes

Morgan Brown is CEO of Wave Imaging Technology Inc., a specialty seismic processing company leading the onshore depth imaging trend. Brown worked in Geophysical R&D positions for Hess and 3DGeo before joining WIT. He holds a B.A. in applied math from Rice University and a Ph.D. in geophysics from Stanford University. He has 15 years of experience in depth imaging.

BOLAND SCHOLARSHIP WATCH

Faculty & Students,

This is a new year and the Mississippi Geological Society along with the Boland Scholarship Fund would like to remind you that we want to honor the most outstanding overall students for the 2012-2013 year.

Each year, the Boland Scholarship awards 1 student from each institution a check that rewards students for their hard work and dedication to the Geosciences and their community.

We look forward to a great year and hope to see you at our monthly meetings.

Best Regards,

Matt Caton
Editor

Jackson, MS 39205-0422**

ARTICLE OF THE MONTH

Why Not a "Lewis & Clark Project" for Energy?

Many people would be surprised to know that regarding our "frontier" regions, those outside of the traditional oil and gas production areas of the Gulf of Mexico, southern offshore California, and onshore continental US, we have precious little actual geological and seismic data to precisely estimate the extent of our resource base.

Although, the U.S. Geological Survey, a scientific bureau within the United States Department of Interior, does a remarkable job assessing domestic energy resources, much of its analysis and assessment is based upon scant, decades old data that possesses a high degree of uncertainty.

The complicated scheme of describing our estimated resource base combines statistical assessment, technological capability, and the economics of production only to baffle the public and confuse government officials tasked to divine an energy strategy.

If we are going to make sound decisions about our energy future, we sorely need credible, scientifically reliable data about the country's resource base. The data gathering should not only include oil & gas, but also coal, uranium, water, wind, and geothermal resources.

That's why Governor Romney's proposal to conduct a comprehensive survey of America's energy reserves makes so much sense. It should be promoted as a "Lewis and Clark Project" to gather much needed technical information about what lies beneath our onshore and offshore property.

In the closing days of the 18th century, Napoleon Bonaparte began maneuvering to restore France's territories in North America. By late 1802, Spain transferred its territory west of the Mississippi along with the shipping rights through New Orleans back to France. American access to the port's warehouses became a critical commercial issue for the United States.

In 1803, President Thomas Jefferson dispatched Secretary of State, James Madison, to join U.S. Minister to France, Robert Livingston, in negotiations to purchase New Orleans along with all or part of Florida. Their ultimate objective was to secure U.S. rights to access the Mississippi River and the port. They were authorized \$10 million for the purchase.

As conditions changed and war with the British appeared likely, Napoleon reconsidered France's place on the continent. When Madison arrived in France in April, 1803, the deal the French presented was for the sale of all of Louisiana — 827,000 squares miles, twice the area of the U.S. Although taken aback, by April 30th, Madison and Livingston reached an agreement to purchase the Louisiana territory, including New Orleans, for \$15 million — well in excess of the initial authorization.

ARTICLE Cont

The official announcement of the Louisiana Purchase was made in Washington on July 4, 1803. The Senate ratified the treaty sale on October 20th and the U.S. took formal possession of the territory in December, 1803.

What is most fascinating, however, is the fact that in January, 1803, before he even knew how the French would react to Madison's mission, Jefferson was preparing for the future. In a confidential letter to Congress, dated January 18, 1803, Jefferson requested an appropriation of funds for the exploration of the continent "for the purpose of extending the external commerce of the United States" and to "incidentally advance the geographical knowledge of our own continent." That letter secured \$2,500 from Congress to cover the costs of the venture we now know as the, "Lewis & Clark Expedition."

Modern parallels can be drawn between the Lewis & Clark Expedition and our current need to survey our energy resources today. As in the early 1800's, we have a notional understanding of our frontier regions. We are in the early stages of assessing those resources, especially regarding federal offshore properties. Development and production in most of these regions is many years, if not decades, away. However, paraphrasing Mr. Jefferson's letter to Congress, today we must "advance the geologic knowledge of our own continent."

A "Lewis and Clark Project" managed by the USGS to evaluate our nation's energy resources is long overdue. If we are going to address our energy situation and craft a rational energy policy, we need to have reliable information about our options. This includes credible data about our energy resource base: oil, gas, coal, uranium, geothermal, water, and wind. Putting off this important survey program will not only delay our ability to access these resources when we need them, but also drive up the cost because the risks associated with investments made on highly uncertain assessments is greater than those made on high quality assessments. Likewise, revenues to the government generated from bids on federal production leases would likely be higher if bidders had better knowledge about what the lease may contain.

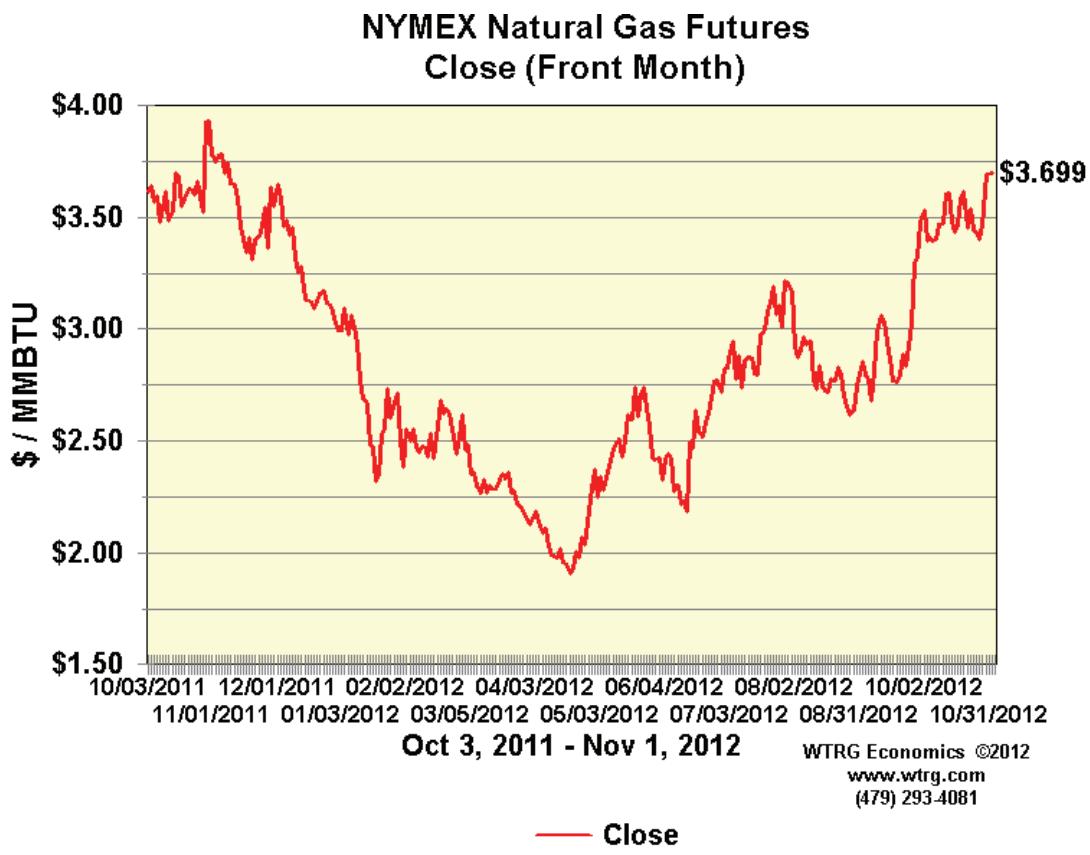

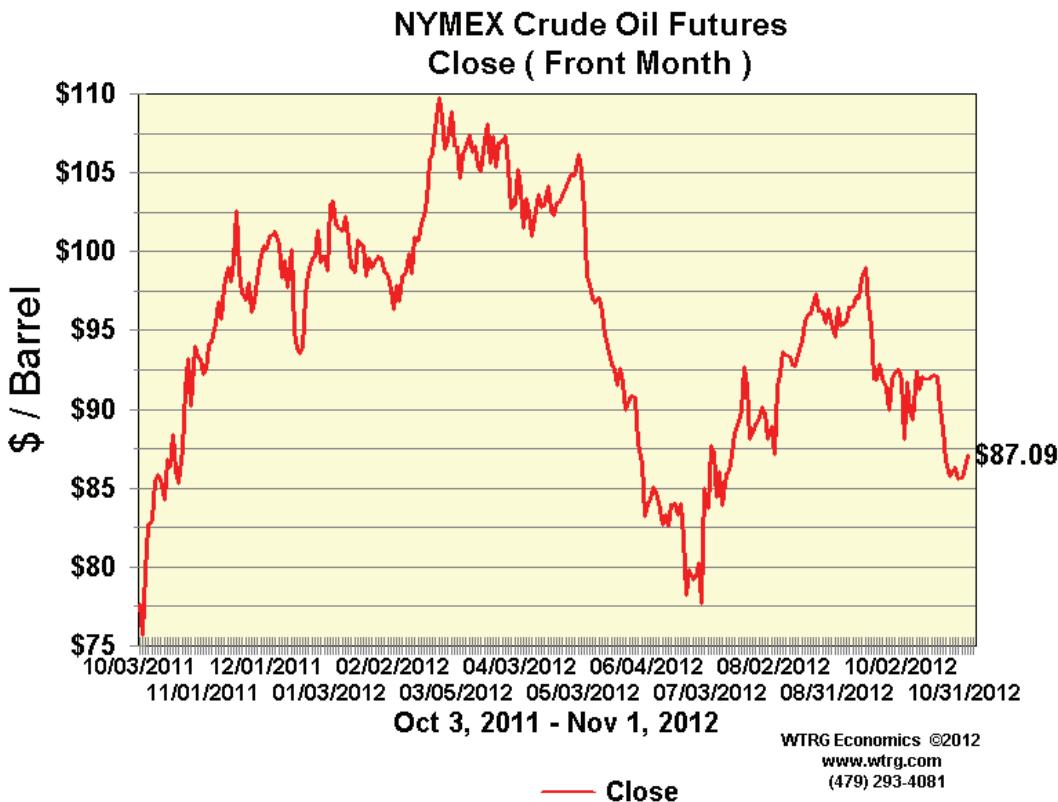

The "Lewis and Clark Project" may also assist in determining where we should not proceed with energy development. For example, a National Marine Sanctuary System with 14 established sanctuaries exists today. Geologic and seismic data collection from "Lewis and Clark" could be coordinated in partnership with ongoing NOAA activities surveying marine and benthic environments to identify highly sensitive areas or support protective zones to avoid or mitigate impacts from possible future development activities. Understanding where and how to develop resources is as important as knowing what lies below the surface.

An initiative such as the "Lewis and Clark Project" should be something everyone can agree to support. This country faces tremendous challenges in deciding how to pursue energy development. A rational, well-conceived energy policy is long overdue. Adding to our knowledge in order to guide sound policy decisions should be a bipartisan priority.

John Hritcko, Jr., is a Houston-based engineer and natural gas industry executive. This column originally appeared on his blog, "[Bridge to the Energy Future](#)."

"A company committed to excellence and achieving success while providing professional permitting acq. & project mgmt. with the client's interests & concerns top priority"

Get More from your Core

With reservoirs becoming increasingly complex, you need the most accurate information you can get to better understand your reservoir.

Weatherford Labs helps you get more from your core by combining an unsurpassed global team of geoscientists, engineers, technicians and researchers with the industry's most comprehensive, integrated laboratory services worldwide. From core analysis, sorption, geochemistry and isotopic composition to detailed basin modeling and comprehensive data packages, we provide you with real reservoir rock and fluid information that hasn't been distilled by a simulator or iterated by software.

We call it "The Ground Truth™" – giving you the accurate answers you need for better reservoir understanding. You'll call it a better return on your reservoir investment. To learn more, contact TheGroundTruth@weatherfordlabs.com.

Denbury Resources, Inc.

Denbury Resources, Inc. is a growing independent oil and gas company. The Company is the largest oil and natural gas operator in Mississippi and Montana, owns the largest reserves of CO₂ used for tertiary oil recovery east of the Mississippi River, and holds significant operating acreage in the Rockies, Permian Basin, Mid-Continent and Gulf Coast. The Company's goal is to increase the value of acquired properties through a combination of exploration, drilling and proven engineering extraction practices, with its most significant emphasis relating to tertiary recovery operations.
